Caring with pride

Information about Pamidronate

Pamidronate is from a group of drugs called Bisphosphonates. These are bone strengthening drugs which help to prevent calcium from leaking out of the bones. It also helps to strengthen your bones and reduce pain.

Prior to attending the Medical Elective Services (MES) you are required to have a blood sample taken and a form should be enclosed for this purpose.

Your Pamidronate will be administered by the nursing team on MES. Once you have been admitted a cannula will be inserted into a vein in your arm.

The Pamidronate will be infused through this over one to two hours, depending on the dose prescribed by your doctor.

After care

You can eat and drink as normal throughout the infusion. Following a short observation period your cannula will be removed and you will be discharged home.

A member of the nursing team will give you advice following infusion and any further appointments you may require on MES for this treatment.

Common side effects reported include flu-like symptoms which could last up to two days. You may also experience worsening bone pain at the start of treatment. This should improve after a few days. If the pain persists please contact your doctor.

Teaching, training & research

Our Trust is committed to teaching, training and research to support the development of health and healthcare in our community. Healthcare students may observe consultations for this purpose. You can opt out if you do not want students to observe. We may also ask you if you would like to be involved in our research.

Feedback

You may receive a Friends and Family card following your treatment. This is to enable us to collect feedback on your experience with us. All feedback is anonymous and lets us constantly review our service to ensure we are maintaining a high standard. We do appreciate you taking the time to complete this for us.
